**Defining the Machine Learning Problem:**

**1. Target Variable:**

The target variable in this problem is Dominant Emotion, it indicates the primary emotional state of a user based on their social media activity.

**2. Type of Machine Learning Problem:**

Classification problem, because the goal is to predict categorical emotional outcomes, not continuous values.

**3. Expected Model Learning / Prediction:**

The machine learning model is expected to learn the relationship between users' behavioral and usage patterns on social media, based on how they use social media.

**4. Problem Description:**

In today real word technology entering our live I all aspect and on social media in one of the technologies applications that effect our live, my classification model predicts a user's dominant emotional state based on their social media usage patterns and demographics. The dataset contains features like daily usage time, posts per day, likes received, comments received, messages sent, age, gender, and platform type.

**Choosing an Open Dataset:**

Social Media Usage and Emotional Well-Being from Kaggle

https://www.kaggle.com/datasets/emirhanai/social-media-usage-and-emotional-well-being

**Loading and Inspecting the Dataset in Python:**
